What is Image Cropping?

Digital images are composed of a grid of vertical and horizontal pixels—in effect, small color squares. Image cropping is a way of photo editing that involves removing a portion of an image, hence reducing the number of pixels and changing the aspect ratio. As a result, you emphasize a subject, reframe it, or direct the viewer's attention to a certain part of the image. You can automate image cropping with scripting languages like JavaScript.

https://veryutils.com/javascript-image-cropper

An image cropper is a web & mobile component which enable the user to resize, move, crop an area of images before they're uploaded to the server. The most typical use is to select, crop and upload local images for avatars, cover photos, portfolio images, etc.
