The SPL (Windows Spool Format) encompasses a variety of formats including PRN, PCL (Printer Command Language), PCL5C, PCL5E, Postscript, EPS (Encapsulated PostScript), XPS (XML Paper Specification), and EMF (Enhanced Metafile). These formats are integral to the Windows printing system and serve various purposes in storing and transmitting print job information.

1. **PRN (Printer) Format:** PRN files contain instructions for the printer and are used to communicate with printers. They contain printer-specific information, allowing for direct communication between the computer and printer.
2. **PCL (Printer Command Language):** PCL is a page description language used to communicate with HP (Hewlett-Packard) printers. It provides commands for formatting and printing documents and is widely supported by various printers.
3. **PCL5C and PCL5E:** These are versions of the Printer Command Language, each with its specific enhancements and features.
4. **Postscript:** Postscript is a page description language developed by Adobe. It's commonly used for printing and is known for its ability to describe both text and graphics in a device-independent manner.
5. **EPS (Encapsulated PostScript):** EPS is a file format that typically contains a high-resolution image or vector graphic. It's often used for high-quality printing and is compatible with Postscript printers.
6. **XPS (XML Paper Specification):** Developed by Microsoft, XPS is an electronic document format that preserves document fidelity and allows for easy sharing and printing.
7. **EMF (Enhanced Metafile):** EMF is a file format used for storing vector-based graphics. It contains a series of drawing commands that can be interpreted by applications and printers supporting the Windows Graphics Device Interface (GDI).
